

ABSTRACT OF THE INVENTION

A fry pan with its position angle adjustable includes a body, a tightening device and a base. The body consists of an upper plate and a lower plate possible to be tightened by the tightening device. The
5 body has a shaft and is pivotally connected with the base with the shaft. The base has a position device connected with the body. The body can be adjusted in its position angle by the shaft functioning as a pivot
10 and then is tightened by said position device at the adjusted sloping angle for fat to flow down easily after adjusted.
